(a) Elicitation and aggregation of the LLM prior

35 of 36 edges match the 35-edge project annotation (precision 0.972, recall 1.000); two broader annotation files differ ($\kappa = 0.128$).

(b) Two uses of the prior in this paper

All four adjacent chain edges are active and correctly oriented, so the provider matches G_{O} on every reachable mask.
